The development in the Fornebu area is at a great scale these days, with housing blocks rising one after the other.

The demand for building material is high, and so is the cost of using conventional methods for building.

Our project title “Under Pressure” refers to both the need for a discussion on building practice, as well as it is describing a material ready to enter the debate.

We want the project to be a laboratory for exploring a form of material that can fit in the nordic context, but also contribute to build on the next chapter of Fornebu, quite literally.

With its spacious design, rich light and breathing body - we believe that this building can live past the demand for material and building products, and indulge into the cultural life of Fornebu.

Connecting to the park that flows between other cultural buildings in the area, the building can become anew, inhabiting other activities and serving another purpose than today.

Or it may solve another issue that is …
under pressure.
